

## 155Mbps 1270nm~1450nm SMF 35dB CWDM 1x9 Optical Transceiver with Duplex SC Connector, 5.0V

CS13xxD-03A-5U-PC-C

### DESCRIPTION

The CS13xxD-03A-5U-PC-C duplex 1x9 optical transceivers are high performance, cost effective optical transceiver modules support data rates up to 155Mb/s. They provide 35dB power budget over single mode fiber. There are ten center wavelengths available from 1270nm to 1450nm with 20nm channel spacing.

### FEATURES

- Compliant with 155 Mbps ATM and SONET OC-3 SDH STM-1
- Industry standard 1x9 footprint
- SC duplex connector
- Single power supply 5.0V
- Differential PECL inputs and outputs
- Compatible with solder and aqueous wash processes
- Class 1 laser product compliant with EN 60825-1
- Input/Output: DC/DC
- Temperature: 0°C to 70°C
- 35dB power budget

### APPLICATIONS

- CWDM Network

**BLOCK DIAGRAM OF TRANSCEIVER**

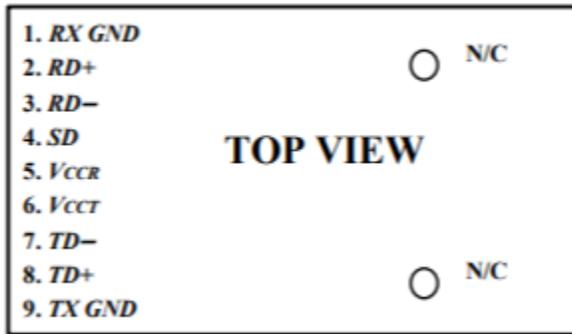

**Transmitter Section** - The transmitter section consists of a 1310 nm InGaAsP in an eye safe optical subassembly (OSA) which mates to the fiber cable. The laser OSA is driven by a LD driver IC which converts differential input PECL logic signals into an analog laser driving current.

**Receiver Section** - The receiver utilizes an InGaAs PIN photodiode mounted together with a trans-impedance preamplifier IC in an OSA. This OSA is connected to a circuit providing post-amplification quantization, and optical signal detection.

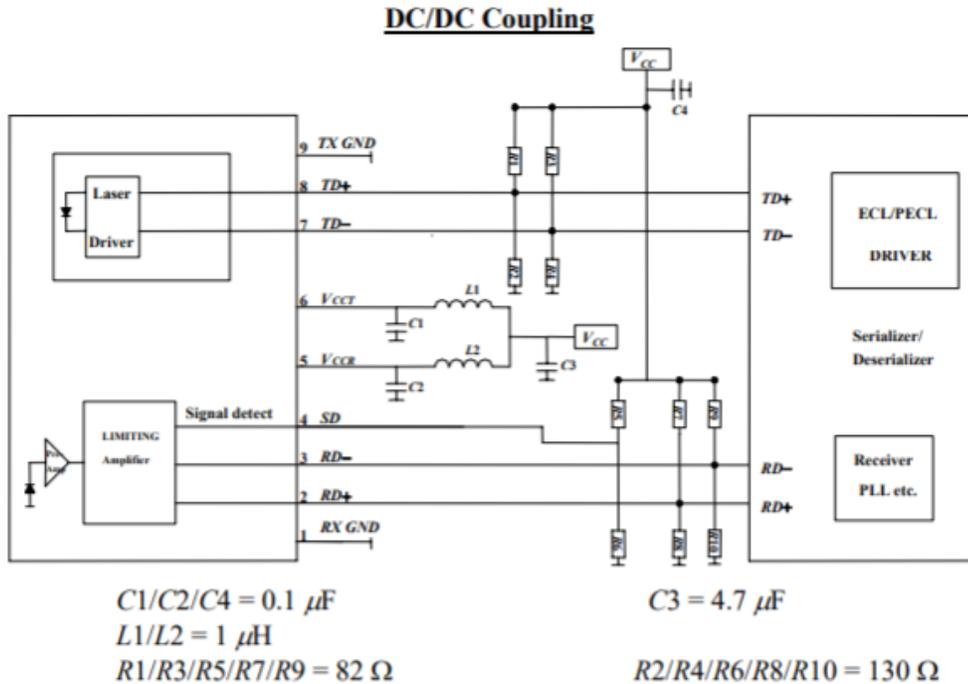

**Receiver Signal Detect** - Signal Detect is a basic fiber failure indicator. This is a single-ended PECL output. As the input optical power is decreased, Signal Detect will switch from high to low (deassert point) somewhere between sensitivity and the no light input level. As the input optical power is increased from very low levels, Signal Detect will switch back from low to high (assert point). The assert level will be at least 1.0 dB higher than the deassert level.

## CONNECTION DIAGRAM

PIN	SYMBOL	DESCRIPTION
1	<i>RX GND</i>	Receiver Signal Ground. Directly connect this pin to the receiver ground plane.
2	<i>RD+</i>	<i>RD+</i> is an open-emitter output circuit. Terminate this high-speed differential PECL output with standard PECL techniques at the follow-on device input pin. (See recommended circuit schematic)
3	<i>RD-</i>	<i>RD-</i> is an open-emitter output circuit . Terminate this high-speed differential PECL output with standard PECL techniques at the follow-on device input pin. (See recommended circuit schematic)
4	<i>SD</i>	Signal Detect. Normal optical input levels to the receiver result in a logic “1” output, $V_{OH}$ , asserted. Low input optical levels to the receiver result in a fault condition indicated by a logic “0” output $V_{OL}$ , deasserted Signal Detect is a single-ended PECL output. <i>SD</i> can be terminated with PECL techniques via $50\ \Omega$ to $V_{CCR} - 2\ \text{V}$ . Alternatively, <i>SD</i> can be loaded with a $180\ \Omega$ resistor to <i>RX GND</i> to conserve electrical power with small compromise to signal quality. If Signal Detect output is not used, leave it open-circuited. This Signal Detect output can be used to drive a PECL input on an upstream circuit, such as, Signal Detect input or Loss of Signal-bar.
5	<i>VCCR</i>	Receiver Power Supply. Provide +5.0 Vdc via the recommended receiver power supply filter circuit. Locate the power supply filter circuit as close as possible to the <i>VCCR</i> pin.
6	<i>V CCT</i>	Transmitter Power Supply. Provide +5.0 Vdc via the recommended transmitter power supply filter circuit. Locate the power supply filter circuit as close as possible to the <i>V CCT</i> pin.
7	<i>TD-</i>	Transmitter Data In-Bar. Terminate this high-speed differential PECL input with standard PECL techniques at the transmitter input pin. (See recommended circuit schematic)
8	<i>TD+</i>	Transmitter Data In. Terminate this high-speed differential PECL input with standard PECL techniques at the transmitter input pin. (See recommended circuit schematic)
9	<i>TX GND</i>	Transmitter Signal Ground. Directly connect this pin to the transmitter signal ground plane. Directly connect this pin to the transmitter ground plane.

## RECOMMENDED CIRCUIT SCHEMATIC

In order to get proper functionality, a recommended circuit is provided in above recommended circuit schematic. When designing the circuit interface, there are a few fundamental guidelines to follow.

- (1) The differential data lines should be treated as 50  $\Omega$  Micro strip or strip line transmission lines. This will help to minimize the parasitic inductance and capacitance effects. Locate termination at the received signal end of the transmission line. The length of these lines should be kept short and of equal length.
- (2) For the high-speed signal lines, differential signals should be used, not single-ended signals, and these differential signals need to be loaded symmetrically to prevent unbalanced currents which will cause distortion in the signal.
- (3) Multi-layer plane PCB is best for distribution of VCC, returning ground currents, forming transmission lines and shielding. Also, it is important to suppress noise from influencing the fiber-optic transceiver performance, especially the receiver circuit.
- (4) A separate proper power supply filter circuits shown in Figure for the transmitter and receiver sections. These filter circuits suppress VCC noise over a broad frequency range, this prevents receiver sensitivity degradation due to VCC noise.
- (5) Surface-mount components are recommended. Use ceramic bypass capacitors for the 0.1  $\mu\text{F}$  capacitors and a surface-mount coil inductor for 1  $\mu\text{H}$  inductor. Ferrite beads can be used to replace the coil inductors when using quieter VCC supplies, but a coil inductor is recommended over a ferrite bead. All power supply components need to be placed physically next to the VCC pins of the receiver and transmitter.
- (6) Use a good, uniform ground plane with a minimum number of holes to provide a low-inductance ground current return for the power supply currents.

**ADDITIONAL NOTES**

- Avoid eye or skin exposure to laser radiations.
- The device is sensitive to electro-static discharge (ESD). The device should be handled with ESD proof tools. To assemble the device on PCB, proper grounding is required to prevent ESD.
- Specifications are subject to change without notice.
